

# 7

## Swaps

*I have friends in overalls whose friendship I would not swap for the favor of the kings of the world.*

—Thomas A. Edison

### Overview

- Mechanics of interest rate swaps
- Day count issues
- (Confirmations – skip)
- The comparative-advantage argument

- The nature of swap rates
- Determining the LIBOR/swap zero rates
- Valuation of interest rate swaps
- Currency swaps
- Valuation of currency swaps
- Credit risk
- Other types of swap
- Summary

---

## Preamble

- First contracts 1980s
- Agreement to exchange cash flows at specified future times according to certain specified rules
- Cash flows from future value of variable: IR, FX, etc.
- Generalises a forward contract if cash settled – swap forward price for market value

Fwd	≡	Swap
• 100 oz Gold		• \$40,000
• \$400/oz		• 100 \$
• +1 yr		• +1 yr

- Multiple dates
- Focus on swaps:
  - plain vanilla interest rate
  - fixed-for-fixed currency

## Nature of Swaps

**Definition 7.1.** A *swap* is an agreement to exchange cash flows at specified future times according to certain specified rules.

---

## Mechanics of interest rate swaps

- Most common – *plain vanilla interest rate swap*

**Definition 7.2.** A *plain vanilla interest rate swap* is an agreement in which a company agrees to pay cash flows equal to interest at a predetermined fixed rate in return for interest at a floating rate, on a notional principal, for a period of time.

- Floating rate typically LIBOR (Chapter 4)
- Reference IR for loans in \_\_\_\_\_ markets (cf. *prime* in \_\_\_\_\_ markets)

### An Example of a “Plain Vanilla” Interest Rate Swap

- An agreement by Microsoft to
  - receive 6-month LIBOR &
  - pay a fixed rate of 5% per annum
  - every 6 months
  - for 3 years on a
  - notional principal of \$100 million

**Figure**

**Figure 7.1:** Interest rate swap between Microsoft and Intel

#### Cash Flows to Microsoft

- See Hull 2006 Table 7.1, page 151

**Table 7.1.** Cash flows (millions of dollars) to Microsoft, in a \$100 million, 3-year interest rate swap, when a **fixed rate of 5%** is paid and **LIBOR** is received. The **net cash flow** is the difference. (Ignore day count issues.)

<i>Date</i>	<i>6-month LIBOR (%)</i>	<i>Floating received</i>	<i>Fixed paid</i>	<i>Net cash flow</i>
Mar. 5, 2004	4.20	-	-	-
Sept. 5, 2004	4.80	+2.10	-2.50	-0.40
Mar. 5, 2005	5.30	+2.40	-2.50	-0.10
Sept. 5, 2005	5.50	+2.65	-2.50	+0.15
Mar. 5, 2006	5.60	+2.75	-2.50	+0.25
Sept. 5, 2006	5.90	+2.80	-2.50	+0.30
Mar. 5, 2007	-	+2.95	-2.50	+0.45

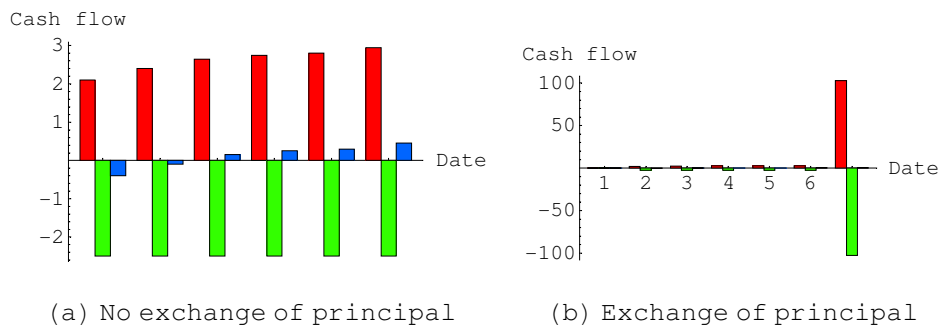

#### Cash Flows to Microsoft – with exchange of principal

**Table 7.2.** Cash flows (millions of dollars) to Microsoft, in a \$100 million, 3-year interest rate swap, when a **fixed rate of 5%** is paid and **LIBOR** is received. The **net cash flow** is the difference.

Date	6-month LIBOR (%)	Floating received	Fixed paid	Net cash flow
Mar. 5, 2004	4.20	-	-	-
Sept. 5, 2004	4.80	+2.10	-2.50	-0.40
Mar. 5, 2005	5.30	+2.40	-2.50	-0.10
Sept. 5, 2005	5.50	+2.65	-2.50	+0.15
Mar. 5, 2006	5.60	+2.75	-2.50	+0.25
Sept. 5, 2006	5.90	+2.80	-2.50	+0.30
Mar. 5, 2007	-	+102.95	-102.50	+0.45

**Code**

**Plot**

**Figure 7.2:** Cash flows (millions of dollars) to Microsoft, in a \$100 million, 3-year interest rate swap, when a **fixed rate of 5%** is paid and **LIBOR** is received. The **net cash flow** is the difference. Variants are (a) without and (b) with exchange of principal at the end.

**Remark**

- The net cash flow is the same whether or not the principal is exchanged.
- Typically the principal is *not* exchanged (hence “notional” principal)
- However, case with exchange of principal gives insight

**Typical Uses of an Interest Rate Swap**

- Converting a liability from
  - fixed rate to floating rate
  - floating rate to fixed rate
- Converting an investment from
  - fixed rate to floating rate
  - floating rate to fixed rate

**Figure**

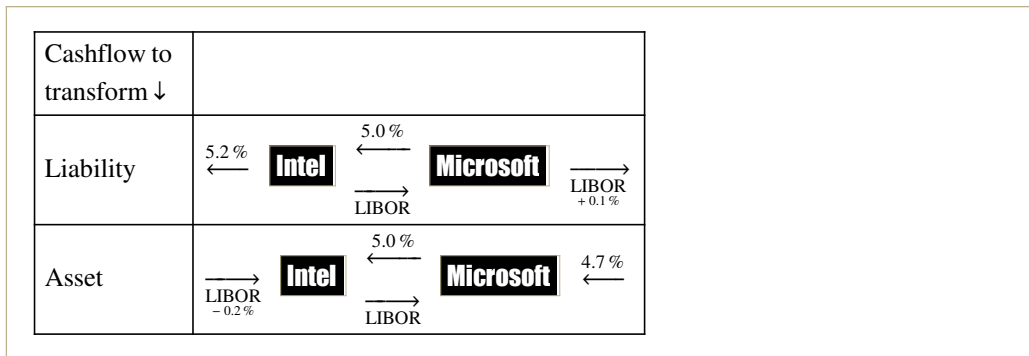

Figure 7.3: Use of an interest rate swap to transform a liability or an asset, without a financial intermediary.

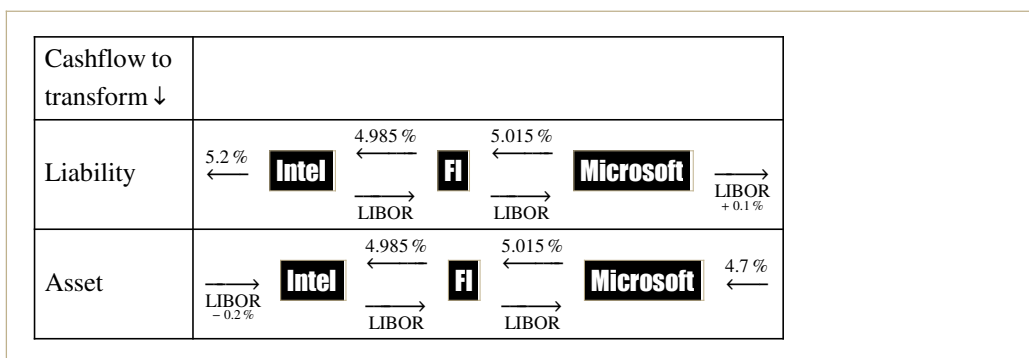

Figure 7.4: Use of an interest rate swap to transform a liability or an asset, with a financial intermediary.

**Transforming a liability**

- Conversion of debt payments
  - Microsoft – from LIBOR + 0.1% to \_\_\_\_\_
  - Intel – from 5.2% to \_\_\_\_\_

**Transforming an asset**

- Conversion of asset cash (in)flows
  - Microsoft – from 4.7% to \_\_\_\_\_
  - Intel – from LIBOR - 0.2% to \_\_\_\_\_

**Financial intermediary**

- Typically earns \_\_\_\_\_ basis points
- Has \_\_\_\_\_ contracts
- If one party defaults does  does not  have to honour its agreement with other

**Further detail**

- Musiela Rutkowski (2004)
- Usually payments are *set in advance, paid/settled in arrears*
- Paid/settled in advance also possible, but arrears payments require discounting
  - Conventions vary

- Discount payments
  - float by float,
  - fixed by float or fix

## Day count issues

- LIBOR (e.g. 6-mo in Table 7.1) is a money market rate, hence quoted on \_\_\_\_\_ basis

**Example 7.1.** The first floating payment in Table 7.1 is for a LIBOR rate of 4.2%. What is the correct interest payment if day count conventions are taken into account?

Reference period Mar 5 to Sept 5, 2004 is 184 days

Interest earned is  $\$100 \times 10^6 \times 0.042 \times \frac{184}{360} = \$2.1467$

## LIBOR-based cash flows

### Notation

$\Lambda$  principal  
 $R$  LIBOR rate  
 $n$  number of days since last payment

- Note: Greek “L”, Lambda, to save “L” for LIBOR rate, below.

### Swap cash flow expression

$$\text{Cash flow} = \frac{\Lambda R n}{360} \quad (7.1)$$

## Fixed rate cash flows

- Usually
  - actual/365
  - 30/360
- Often factor 360/365 required to compare 6-mo LIBOR with fixed

## The comparative-advantage argument

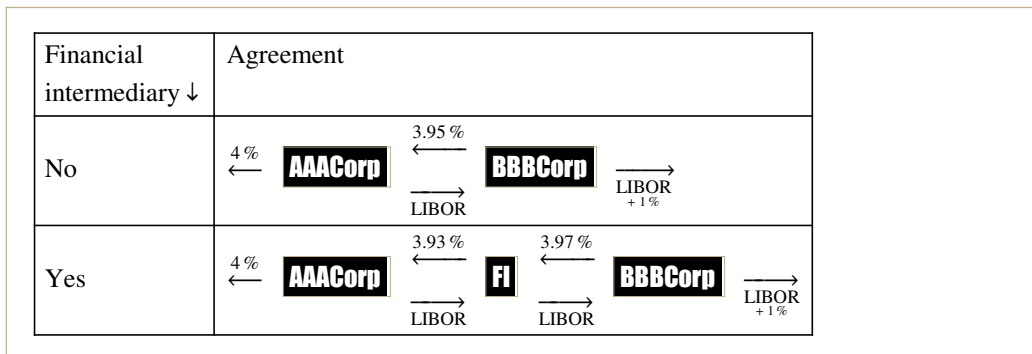

### The Comparative Advantage Argument

- Hull Table 7.4, page 157
- AAACorp wants to borrow floating
- BBBCorp wants to borrow fixed

**Table 7.3.** Borrowing rates for two corporations

<i>Company</i>	<i>Fixed</i>	<i>Floating</i>
AAACorp	4.0%	LIBOR + 0.3%
BBBCorp	5.2%	LIBOR + 1.0%

- Key feature – difference between \_\_\_\_\_ rates, greater than between \_\_\_\_\_ rates
- { AAACorp } has a comparative advantage in { \_\_\_\_\_ } markets
- { BBBCorp }

**Figure 7.5:** Illustration of comparative advantage agreement for two corporations, without and with a financial intermediary.

### Criticism of the Comparative Advantage Argument

- 4.0% and 5.2% rates available to AAACorp and BBBCorp in fixed rate markets are 5-year rates
- The LIBOR+0.3% and LIBOR+1% rates available in the floating rate market are six-month rates
- BBBCorp’s fixed rate depends on spread above LIBOR it borrows at in the future

## The Nature of Swap Rates

- Six-month LIBOR is short-term AA borrowing rate

- 5-year swap rate has risk ~ 10 six-month loans made to AA borrowers at LIBOR
- Lender can enter into swap – income from LIBOR loans exchanged for 5-year swap rate

## Swap rates

### Practical definition

**Definition 7.3.** *Swap rates* are the fixed rates at which financial institutions offer interest rate swap contracts to their clients.

- M&R 2004, p. 328

### Theoretical definition

**Definition 7.4.** The *swap rate* is that value of the fixed rate that makes the value of the swap zero at inception.

- M&R 2004, p. 479
- Cf. forward interest rate and value of FRA
- Institutions offer swap contracts at rates with appropriate spreads above and below the theoretical ones

---

## Determining the LIBOR/swap zero rates

- Risk-free rates for derivative valuation purposes
  - LIBOR  $\leq$  12 mos
  - Eurodollar futures 1-2 yrs
  - Swaps  $\geq$  2 yrs
- *LIBOR/swap zero curve*
- Chapter 4 “par yields” – now put to use!

### Overview of argument

- Consider a new swap with fixed rate = swap rate
- Add principals on both sides on final payment date  $\Rightarrow$  swap  $\equiv$  exchange of fixed rate and floating rate bonds
- Value of bonds/swaps
  - Floating-rate rate bond – \_\_\_\_\_ \*
  - Swap – \_\_\_\_\_.
- $\Rightarrow$  fixed-rate bond worth \_\_\_\_\_.
- $\Rightarrow$  swap rates define par yield bonds; used to bootstrap the LIBOR (or LIBOR/swap) zero curve
- \* Argument below

## Swap rates from bond prices

### Notation

$S_n$  swap rate for an  $n$ -year agreement

### Result

**Proposition 7.5.** The  $n$ -period swap rates  $S_n$  can be expressed in terms of prices of zero coupon bonds  $P_{0n}$  by the relationship  $S_n = \frac{1 - P_{0n}}{\sum_{i=1}^n P_{0i}}$

$$S_n = \frac{1 - P_{0n}}{\sum_{i=1}^n P_{0i}} \tag{7.2}$$

- No surprises here; this was expression for par yield from Chapter 4

### Mathematica implementation to explore terms

$$\text{SwapRate}[n\_]:= \frac{1 - P[0, n]}{\sum_{i=1}^n P[0, i]}$$

`Table[{S[n], SwapRate[n]}, {n, 3}] // TableForm`

```
S[1]      1-P[0,1]
          P[0,1]
S[2]      1-P[0,2]
          P[0,1]+P[0,2]
S[3]      1-P[0,3]
          P[0,1]+P[0,2]+P[0,3]
```

### Proof

- Consider 4-year swap

Figure 7.6: Diagram of cashflows for fixed leg of a 4-year swap agreement

- Pay 1 to get
  - 4 coupons of swap rate
  - initial investment back at 4

$$1 = S_4 P_{01} + S_4 P_{02} + S_4 P_{03} + (1 + S_4) P_{04}$$

- Similarly for  $n = 1, 2, 3, \dots$

## Bond prices from swap rates

### Result

**Proposition 7.6.** The prices of zero coupon bonds  $P_{0n}$  can be expressed in terms of the  $n$ -period swap rate  $S_n$  by the relationship  $P_{0n} = 1 - S_n \sum_{r=0}^{n-1} \prod_{k=0}^r \frac{1}{1+S_{n-k}}$

$$P_{0n} = 1 - S_n \sum_{r=0}^{n-1} \prod_{k=0}^r \frac{1}{1 + S_{n-k}} \quad (7.3)$$

**Mathematica implementation to explore terms**

$$\text{ZeroBond}[n\_] := 1 - S[n] \sum_{r=0}^{n-1} \prod_{k=0}^r \frac{1}{1 + S[n - k]}$$

`Table[{P[0, n], ZeroBond[n]}, {n, 3}] // TableForm`

$$P[0, 1] \quad 1 - \frac{S[1]}{1+S[1]}$$

$$P[0, 2] \quad 1 - S[2] \left( \frac{1}{1+S[2]} + \frac{1}{(1+S[1])(1+S[2])} \right)$$

$$P[0, 3] \quad 1 - S[3] \left( \frac{1}{1+S[3]} + \frac{1}{(1+S[2])(1+S[3])} + \frac{1}{(1+S[1])(1+S[2])(1+S[3])} \right)$$

**Proof**

- The swap rate is the level of the fixed rates such that the swap has zero value at inception
- Zero value occurs when floating rate bond equals fixed rate bond
- At inception, value of floating rate bond is unity (up to a common factor of the principal)

$$\begin{aligned} 1 &= (1 + S_1) P_{01} \\ 1 &= S_2 P_{01} + (1 + S_2) P_{02} \\ 1 &= S_3 P_{01} + S_3 P_{02} + (1 + S_3) P_{03} \\ &\vdots \\ 1 &= S_n \sum_{i=1}^n P_{0i} + P_{0n} \\ &\vdots \end{aligned}$$

- Solve iteratively in terms of  $P_{0i}$

$$\begin{aligned} P_{01} &= \frac{1}{(1+S_1)} = 1 - \frac{S_1}{1+S_1} \\ P_{02} &= \frac{1-S_2 P_{01}}{1+S_2} = \frac{1}{1+S_2} - \frac{1}{1+S_2} \frac{S_2}{1+S_1} \\ &= \frac{1+S_2-S_2}{1+S_2} - \frac{1}{1+S_2} \frac{S_2}{1+S_1} = 1 - \frac{S_2}{1+S_2} - \frac{1}{1+S_2} \frac{S_2}{1+S_1} \\ &= 1 - S_2 \left( \frac{1}{1+S_2} + \frac{1}{1+S_1} \frac{1}{1+S_2} \right) \\ P_{03} &= \dots = 1 - S_3 \left( \frac{1}{1+S_3} + \frac{1}{(1+S_2)(1+S_3)} + \frac{1}{(1+S_1)(1+S_2)(1+S_3)} \right) \\ &\vdots \\ P_{0n} &= 1 - S_n \sum_{r=0}^{n-1} \prod_{k=0}^r \frac{1}{1+S_{n-k}} \\ &\vdots \end{aligned}$$

**FRNs are worth par after a coupon payment**

- Not in Hull
- This argument courtesy of L.P. Hughston.

**Notation**

$a, b$	start and end of time interval
$P_{ab}, P(a, b)$	price of zero-coupon bond at $a$ , with unit payoff at $b$
$L_{ab}$	LIBOR interest rate
$n$	number of days since last payment

**Setup**

- Consider a 3-yr investment paying a LIBOR coupon, annually

Figure 7.7: Diagram of cashflows for 3-yr investment paying a LIBOR coupon, annually

- With a compounding frequency of  $m = \frac{1}{b-a}$ , the LIBOR rate and price of a zero coupon bond are related:

$$P_{ab} = \frac{1}{1 + L_{ab}(b - a)} \tag{7.4}$$

- For our simple case,  $b - a = 1$

$$L_{ab} = \frac{1}{P_{ab}} - 1$$

**Argument**

- Each LIBOR coupon payment is discounted back to the previous payment date using a LIBOR discount rate

Figure 7.8: Diagram of cashflows for 3-yr investment with LIBOR coupons expressed in terms of bond prices

- Value of 3rd coupon at time 2

$$\left( \frac{1}{P_{23}} - 1 + 1 \right) \frac{1}{1 + L_{23}} = 1$$

- Value of 3rd and 2nd coupons at time 1

$$\left( \frac{1}{P_{12}} - 1 + \frac{\text{previous step}}{1} \right) \frac{1}{1 + L_{12}} = 1$$

- Repeat iteratively down to  $t = 0$

- Value of 3rd, 2nd & 1st coupons at time 0

$$\left( \frac{1}{P_{01}} - 1 + \frac{\text{previous step}}{1} \right) \frac{1}{1 + L_{12}} = 1$$

If coupon has just been paid, floating rate note is worth par

- For an alternative proof see e.g. Cuthbertson & Nitzsche (2001) *Financial Engineering: Derivatives and Risk Management*

### Example

**Example 7.2.** The 6, 12 & 18-month zero rates have been determined to be 4%, 5% & 4.8%, respectively. The 2-year semi-annually compounded swap rate is 5%. Find the 2-yr zero rate.

Bond with semi-annual coupon of 5% sells for par  
 $0.025 \times (e^{-0.04 \times 0.5} + e^{-0.05 \times 1.0} + e^{-0.048 \times 1.5}) + 1.025 \times e^{-r_2 \times 2.0} = 1$   
 $r_2 = 4.953\%$

## Valuation of interest rate swaps

- Swap  $\equiv$ 
  - long position in one bond with a short position in another
  - portfolio of forward rate agreements

### Valuation in terms of bond prices

- Valuation of bonds
  - fixed rate – usual way
  - floating rate – worth par immediately after next payment date

### Notation

$V_{\text{swap}}$	value of swap
$B_{\text{fix}}$	value of fixed rate bond
$B_{\text{fl}}$	value of floating rate bond
$c_i$	cash flow at time $T_i$
$r_i$	zero coupon yield for interval $[0, T_i]$
$n$	number of payments

### Swap value

$$V_{\text{swap}} = B_{\text{fix}} - B_{\text{fl}} \quad (7.5)$$

**Fixed rate bond**

$$\begin{aligned}
 B_{\text{fix}} &= \sum_{i=1}^n c_i e^{-r_i T_i} + \Lambda e^{-r_n T_n} \\
 &= \sum_{i=1}^n c_i P_{0i} + \Lambda P_{0n}
 \end{aligned}
 \tag{7.6}$$

**Value of floating rate bond**

**Notation**

$k^*$	next coupon payment
$t^*$	time to next coupon payment
$r^*$	zero coupon bond discount rate over $[0, t^*]$

**Table 7.4.** Expressions for the value of a floating rate bond

<i>Time, relative to coupon payment</i>	<i>Head</i>
Immediately after	$\Lambda$
Immediately before	$\Lambda+k^*$
Time $t^*$ before	$(\Lambda+k^*) e^{-r^* t^*}$

**Universal swap pricing formula**

- In your next course on swaps
- Value at  $t$  of forward start payer swap

$$V_{\text{swap}}(t, S) = P(t, T_0) - \sum_{i=1}^n S P(t, T_i) - P(t, T_n)
 \tag{7.7}$$

- M&R (2004) p. 477
- Luenberger (1998) p. 275
- Cuthbertson & Nitzsche (2001) p.380

**Example**

**Example 7.3.** Value a swap between 6-mo LIBOR and 8% fixed with semi-annual compounding, with principal of \$100mi and remaining life of 1.25 years. LIBOR rates for 3, 9 & 15 month maturities are 10%, 10.5% & 11%, resp. The 6-mo LIBOR rate at the last payment date was 10.2%.

$K^* = 0.5 \times 0.102 \times 100 = \$5.1 \text{ mi}$   
 $T^* = 1.25$   
 See table for valuation of  $B_{\text{fix}}$  and  $B_{\text{fl}}$   
 $V_{\text{swap}} = B_{\text{fix}} - B_{\text{fl}} = (\$98.238 - \$102.505) \times 10^6 = -\$4.267 \text{ mi}$

**Table 7.5.** Table accompanying exercise

Time	$B_{\text{fix}}$ cash flow	$B_{\text{fl}}$ cash flow	Discount factor	PV $B_{\text{fix}}$ cash flow	PV $B_{\text{fl}}$ cash flow
0.25	4.0	105.100	$e^{-0.1 \times 0.25}$	3.901	102.505
0.75	4.0		$e^{-0.105 \times 0.75}$	3.697	
1.25	104.0		$e^{-0.11 \times 1.25}$	90.640	
Total				98.238	102.505

### Valuation in Terms of FRAs

- Each exchange of payments in IR swap is FRA
- FRA values – assume today's forward rates are realized
- Steps
  - Obtain forward rates from zero rates
  - Replace random floating rates by forward rates
  - Discount and sum

#### Example

**Example 7.4.** Value the swap from the previous example, but considering it as a portfolio of FRAs.

Fixed rate is  $100 \times 0.06 \times 0.5 = 4.0$   
 Floating payment at 3mos, already known  
 For remaining floating payments, replace random future rate by forward (FRA pricing trick)  

$$R_F = \frac{R_2 T_2 - R_1 T_1}{T_2 - T_1}$$

$$R_{3,9} = \frac{0.105 \times 0.75 - 0.10 \times 0.25}{0.5} = 0.1075 \text{ (c.c.)}$$
 i.e. 11.044% with semi annual compounding  
 Similarly for  $R_{9,15}$ .

**Table 7.6.** Table accompanying exercise

Time	Fixed cash flow	Float cash flow	Net	Discount factor	PV net cash flow
0.25	4.0	$100 \times 0.102 \times 0.5 = -5.100$	-1.100	$e^{-0.1 \times 0.25}$	-1.073
0.75	4.0	$100 \times 0.11044 \times 0.5 = -5.522$	-1.522	$e^{-0.105 \times 0.75}$	-1.407
1.25	4.0	-6.051	-2.051	$e^{-0.11 \times 1.25}$	-1.787
Total					-4.267

- Agrees ☹
- At inception, and later, FRAs do not have zero value

## Currency swaps

### An Example of a Currency Swap

- An agreement to
  - pay 11% on a sterling principal of £10,000,000 &
  - receive 8% on a US\$ principal of \$15,000,000
  - every year for 5 years

Figure 7.9: Currency swap between IBM and BP

### Exchange of principal

- In an interest rate swap the principal is not exchanged
- In a currency swap the principal is usually exchanged at the beginning and the end of the swap's life

### The Cash Flows

- Hull Table 7.7, page 166
- Fixed-for-fixed

Table 7.7. Cash flows to IBM due to currency swap contract with BP

<i>Year</i>	<i>\$</i>	<i>£</i>
2004	-15.00	+10.00
2005	+0.60	-0.70
2006	+0.60	-0.70
2007	+0.60	-0.70
2008	+0.60	-0.70
2009	+15.60	-10.00

### Typical Uses of a Currency Swap

- Conversion from a liability in one currency to a liability in another currency
- Conversion from an investment in one currency to an investment in another currency

### Comparative Advantage Arguments for Currency Swaps

- Hull Table 7.8, page 167
- General Motors wants to borrow AUD
- Qantas wants to borrow USD

**Table 7.8.** Rates for borrowing available to two companies in two currencies.

<i>Company</i>	<i>USD</i>	<i>AUD</i>
GM	5 %	12.6 %
Qantas	7 %	13.0 %

- { <sup>GM</sup> / <sub>Qantas</sub> } has a comparative advantage in the {        } market
- Difference between { <sup>USD</sup> / <sub>AUD</sub> } rates is {        }
- Total gains to all parties        =

**Figure**

**Figure 7.10:** Currency swap between IBM and BP with financial intermediary.

## Valuation of currency swaps

- Like interest rate swaps, currency swaps can be valued either as the difference between 2 bonds or as a portfolio of forward contracts

## Swaps & Forwards

- A swap can be regarded as a convenient way of packaging forward contracts
- The “plain vanilla” interest rate swap in our example consisted of 6 FRAs
- The “fixed for fixed” currency swap in our example consisted of a cash transaction & 5 forward contracts
- The value of the swap is the sum of the values of the forward contracts underlying the swap
- Swaps are normally “at the money” initially
- This means that it costs nothing to enter into a swap
- It does not mean that each forward contract underlying a swap is “at the money” initially

---

## Credit risk

- A swap is worth zero to a company initially
- At a future time its value is liable to be either positive or negative
- The company has credit risk exposure only when its value is positive

---

## Other types of swap

- Floating-for-floating interest rate swaps,
- amortizing swaps,
- step up swaps,
- forward swaps,
- constant maturity swaps,
- compounding swaps,
- LIBOR-in-arrears swaps,
- accrual swaps,
- diff swaps,
- cross currency interest rate swaps,
- equity swaps,
- extendable swaps,
- puttable swaps,
- swaptions,
- commodity swaps,
- volatility swaps
- etc.....

---

## Summary

- Most common: IR and FX
  - IR swap: exchange fixed for floating rate on notional principal over period of time
  - FX swap: exchange fixed in one FX for fixed in other FX on principals in each FX
- Principal exchanged
  - IR swap: no
  - FX swap: yes
- Used to transform payments associated with a loan or an asset from
  - IR – fixed to floating, or vice versa
  - FX – one FX to another
- Value IR loan as
  - fixed and floating bonds
  - portfolio FRAs
- Financial institution exposed to credit risk. If one counter party defaults, with +ve value, still has to honour agreement with other.
